## EXECUTIVE SUMMARY

---

This summary report documents stormwater monitoring data collected by the Caltrans Stormwater Monitoring & Research Program during the 2002-03 monitoring season. The purpose of this report is to provide a compilation of summary and raw data collected and/or reported by various Caltrans monitoring studies. For detailed information on the various monitoring studies and activities, as well as any analyses of the data, presented herein refer to corresponding draft, interim, or final monitoring reports on file with Caltrans and listed in the body and references section of this report.

Within the span of the 2002-03 season Caltrans collected samples at one hundred and twenty-six (126) different sites throughout California, covering all twelve (12) Caltrans districts and all nine (9) Regional Water Quality Control Boards. Water quality and sediment samples were analyzed for a variety of constituents, classified as conventionals, hydrocarbons, anions & cations, metals, microbiologicals, nutrients, pesticides, and semi-volatile organic compounds. Some water quality samples were also evaluated for their toxicity to sensitive aquatic species. Sediment samples were also analyzed to assess various physical parameters. Additionally, small particle characterization and grain size distribution data were reported for some water quality and sediment samples, respectively. Litter data were reported from the Phase II & III Gross Solids Removal Devices pilot study. Some monitoring studies which reported data for the 2002-03 monitoring season also reported data collected during previous years, thus these studies feature summary statistics covering two or more monitoring seasons.

The data reported here are grouped into two major Caltrans characterization activities: Stormwater Quality Characterization and Research, and Stormwater Treatment Technology Pilot Study Activities. The available 2002-03 water quality, sediment, litter and aquatic toxicity data associated with these two major characterization activities are presented by the following individual characterization activities:

### **STORMWATER QUALITY CHARACTERIZATION AND RESEARCH**

#### ***Statewide Characterization Activities***

The Statewide Stormwater Runoff Characterization Study is a multi-year study designed to characterize the quality of stormwater runoff from representative Caltrans facilities. Monitoring sites were selected to represent typical Caltrans operations in all Caltrans Districts. The 2002-03 statewide characterization

activities included the monitoring of runoff from the following Caltrans facility types:

#### Congested/Free-Flowing Highway Runoff Characterization

Activity focused on the collection of water quality samples from both congested and free-flowing highways in San Diego (Caltrans District 11) to characterize stormwater discharges from these facilities. The activity evaluated constituents classified as conventionals, hydrocarbons, metals, nutrients, and pesticides at four monitoring sites.

#### Caltrans Vehicle Inspection Facility Runoff Characterization

Activity focused on the collection of water quality samples from Caltrans vehicle inspection facilities in the Bay Area and San Diego (Caltrans Districts 4 and 11, respectively) to characterize stormwater discharges from these facilities. The activity evaluated constituents classified as conventionals, metals, nutrients, and pesticides at two monitoring sites.

#### Statewide Highway Runoff Characterization

Activity focused on the collection of water quality samples from non-urban (AADT  $\leq$  30,000 vehicles/day) and urban (AADT  $>$  30,000 vehicles/day) highways throughout the State (encompassing Caltrans Districts 1, 2, 3, 4, 5, 6, 8, 9, 10, and 11) to characterize stormwater discharges from these facilities. The activity evaluated constituents classified as conventionals, metals, nutrients, and pesticides at 30 monitoring sites.

#### Maintenance Yard Runoff Characterization

Activity focused on the collection of water quality samples from Caltrans maintenance yards in the Central Valley, Bay Area, and Santa Ana (Caltrans Districts 3, 4, and 12, respectively) to characterize stormwater discharges from these facilities. The activity evaluated constituents classified as conventionals, metals, nutrients, and pesticides at three monitoring sites.

#### Park & Ride Runoff Characterization

Activity focused on the collection of water quality samples from Caltrans park & ride facilities in the Bay Area, Central Valley, and Southern California (encompassing Caltrans Districts 3, 4, 7, 8, 10, and 12) to characterize stormwater discharges from these facilities. The activity evaluated constituents classified as conventionals, metals, nutrients, pesticides, and semi-volatile organics at eight monitoring sites.

### Rest Area Runoff Characterization

Activity focused on the collection of water quality samples from Caltrans rest areas in the Central Valley and Central Coast (encompassing Caltrans Districts 2, 5, and 6) to characterize stormwater discharges from these facilities. The activity evaluated constituents classified as conventionals, metals, nutrients, and pesticides at three monitoring sites.

### Toll Plaza Runoff Characterization

Activity focused on the collection of water quality samples from a single Caltrans toll plaza in the Bay Area (Caltrans District 4) to characterize stormwater discharges from this type of facility. The activity evaluated constituents classified as conventionals, metals, nutrients, and pesticides.

### Tahoe Basin Highway Runoff Characterization and Sand Trap Effectiveness Studies

The Tahoe Basin Highway Runoff Characterization and Sand Trap Effectiveness studies collectively characterized runoff water quality, precipitation quality, sediment quality, small particle distribution, and evaluated the effectiveness of double-barrel sand traps to reduce pollutants concentrations in highway runoff and to retain sediments transported with the runoff.

- **Tahoe Basin Runoff Characterization**

Activity focused on the collection of water quality samples (highway runoff and snowmelt runoff) and precipitation samples (rainfall and snowfall) in the Tahoe Basin (Caltrans District 3) to (1) characterize stormwater discharges from highway facilities, and (2) assess precipitation quality and evaluate the relative contribution of precipitation to pollutant concentrations found in Tahoe area highway runoff. The activity evaluated constituents classified as conventionals, hydrocarbons, anions & cations, metals, and nutrients at six monitoring sites.

- **Tahoe Basin Sediment Characterization**

Activity focused on the collection of sediment and particle samples from highways in the Tahoe Basin (Caltrans District 3) to characterize the sediment retained by double-barrel sand traps and particles discharged from the traps in terms of grain size fraction and chemical content. The activity evaluated sediment samples for constituents classified as conventionals, metals, and nutrients at 11 monitoring sites, as well as evaluated particle samples to determine particle size and count distribution at 15 monitoring sites.

## ***Specialized Characterization Activities***

### **Comprehensive Highway Runoff Characterization**

The monitoring of stormwater discharges from Caltrans highway facilities was conducted by a number of monitoring studies in addition to the Statewide Stormwater Runoff Characterization Study. These additional highway runoff data augment data collected by the Statewide study to further expand the scope of the Caltrans highway runoff characterization data set. Highway runoff data collected throughout the State as part of six separate monitoring studies were compiled and summary statistics generated to characterize stormwater discharges from this facility type. The activity evaluated constituents classified as conventionals, hydrocarbons, anions & cations, metals, microbiologicals, nutrients, pesticides, and semi-volatile organics at 55 monitoring sites.

### **First Flush Characterization Study**

The storm water first flush characterization study was initiated in 1999-2000 to determine both the seasonal and storm-specific first flush effects. Activity focused on the collection of first flush, discrete, and whole storm composite water quality samples from Caltrans highway sites in the Los Angeles area (encompassing Caltrans District 7) to characterize first flush stormwater discharges from these facilities. The activity evaluated constituents classified as conventionals, hydrocarbons, metals, and nutrients at three monitoring sites. A comprehensive analysis and evaluation of the first flush stormwater runoff characterization data will be performed and a final report will be prepared by December 30, 2003.

### **Phase II & III Gross Solids Removal Devices Pilot Study**

The second and third phases of the Gross Solids Removal Devices pilot study evaluated selected devices in Southern California (Caltrans Districts 7 and 12) that can be incorporated into existing and future highway drainage systems to capture litter and incidental coarse solids, collectively described as gross solids. The activity characterized the amount of gross solids captured at four monitoring sites, each possessing a distinct litter removal device, and assessed the effectiveness of these devices in reducing gross solids from highway runoff.

### **Roadside Vegetative Treatment Site Study**

The Roadside Vegetated Treatment Sites (RVTS) Study is a 2-year water quality monitoring project undertaken to evaluate the removal of storm water contaminants by existing vegetated slopes adjacent to freeways. The objectives of this study were to determine if standard roadway design requirements result in biofilter strips with treatment equivalent to those specifically engineered for

water quality performance and to generate design criteria. Activity focused on the collection of runoff data from the inlets and outlets along eight vegetated slopes in the Central Valley, Bay Area, Santa Ana, and San Diego (encompassing Caltrans Districts 2, 3, 4, 8, 11, 12), and sediment data from the outlets of those slopes. The activity evaluated constituents classified as conventionals, metals, nutrients, and sample physical parameters (sediment monitoring only). The study has been completed and is currently in draft report stage. Completion of the final report is expected in the fall of 2003.

### Aquatic Toxicity Study

The three-year Aquatic Toxicity study was designed to assess the toxicity of stormwater runoff discharged from a variety of Caltrans facility types. Water quality samples from 40 Statewide monitoring sites were evaluated during 2000-2003 for their toxicity to sensitive aquatic species as an adjunct to the Statewide Stormwater Runoff Characterization Study. During 2000-01 and 2001-02 Phase I TIEs (toxicity identification evaluations) were conducted on those water samples showing initial chronic toxicity in an effort to identify the general class of chemical causing the observed toxicity in the test samples. During 2002-03 only monitoring sites that had repeatedly showed toxicity in previous years (17 total) were monitored. Again, Phase I TIEs were performed on water samples showing initial chronic toxicity. Additionally, Phase II TIEs were performed on samples having non-polar organic compounds identified as the putative toxicant during Phase I TIE manipulations.

## **STORMWATER TREATMENT TECHNOLOGY PILOT STUDY ACTIVITIES**

### Compost Stormwater Filter System Monitoring – State Route 73 Pilot Study

Activity focused on the collection of water quality samples from compost stormwater filter (CSF) systems located along State Route 73 (Caltrans District 12) to determine whether this treatment technology device could effectively remove pollutants of concern, and whether or not the device contributed to the addition of nutrients to receiving waters. The activity evaluated conventionals, hydrocarbons, metals, microbiologicals, nutrients, and semi-volatile organic compounds at 13 monitoring sites.

### Sand Media Filter Effectiveness Pilot Study

Activity focused on the collection of water quality samples at two sand filters in cold climates. The objectives of the study include:

- Assessing the effectiveness of the two sand filters by monitoring influent and effluent water quality and calculating the reduction in pollutant loading.

- Documenting the construction costs, maintenance costs, and maintenance requirements of the two different sand filters.

The Mountain Gate site was operational in January 2002 and the Shasta site was operational in May 2002. Monitoring has been completed for one and a half years at the Mountain Gate site and for one year at the Shasta site. Activity focused on the collection of stormwater and snowmelt runoff at two sand media filter inlets and outlets in the northern Central Valley area (Caltrans District 2). The activity evaluated water quality samples for conventionals, metals, and nutrients.

### Tahoe Basin Sand Trap Effectiveness Pilot Study

Activity focused on the collection of water quality and sediment samples from double-barrel sand traps in the Lake Tahoe Basin (Caltrans District 3) to access the effectiveness of the traps to reduce constituent concentrations in highway runoff and to retain sediments transported with the runoff. The activity evaluated water quality samples for conventionals, hydrocarbons, anions & cations, metals, and nutrients, and evaluated sediment samples for grain size distribution at four monitoring sites.

This report briefly describes the different types of data collected during the 2002-03 monitoring season and presents tables listing associated monitoring sites and summaries of monitoring results. Summary statistics include observed range, mean, standard deviation, number of samples, and percent detected for each constituent monitored. The complete dataset for 2002-03, organized by category, is presented in the appendices which are included within the attached compact disc.

## NOTES ON REPORTING

---

Throughout this report, data from all study sites are summarized by observed range (minimum - maximum reported values). When this range is bounded by a non-detected value, the range boundary is given as "<" (less than) the reporting limit.

The Caltrans Data Analysis Tool was used when calculating the mean and standard deviation for those data sets containing non-detect data. In the statistical summary tables, constituents showing no mean or standard deviation values (i.e., "---") had insufficient detected data to perform these analyses.

Total metals data are sometimes reported as "total recoverable" due to some differences in the sample digestion process for the total metals analysis. However, for reporting simplicity and statistical analysis, all metals are listed in the summary tables as either dissolved or total fractions. The original fractions are shown in the appendices, and are described as either dissolved, total, or total recoverable as determined by the laboratory.

The "Site List" summary tables provided for all runoff characterization studies presented in this report divide the "Monitoring Site ID" for each monitoring location into two component parts: "Caltrans District" and "Site Number". For example, the Monitoring Site ID "7-201" is presented with a Caltrans District value of "7" and a Site Number value of "201". By definition, Monitoring Site ID "7-201" is located in Caltrans District 7 (the Caltrans District in which the monitoring site is located is noted by the number to the left of the hyphen). Caltrans Districts are numbered uniquely from 1 to 12. Site Numbers are non-unique in that individual sites in *different* Caltrans Districts can possess the same Site Number. For example, Site Number "201" exists in Caltrans District 6 (Monitoring Site ID "6-201"), and Site Number "201" also exists in Caltrans District 7 (Monitoring Site ID "7-201"). The combination of Caltrans District and Site Number produce a unique Monitoring Site ID (Caltrans District X-Site Number Y) for each Caltrans monitoring location in the State.

## **SECTION 1. INTRODUCTION**

---

This report describes the monitoring data submitted as part of the 2002-03 Caltrans Stormwater Monitoring & Research Program. The purpose of the report is to present, in summary format, the results of the water quality, sediment, litter and aquatic toxicity data generated during 2002-03 under the Caltrans Monitoring and Water Quality Research Program. Some monitoring studies which reported data for the 2002-03 monitoring season also reported data collected during previous years, thus these studies feature summary statistics covering two or more monitoring seasons.

During 2002-03, the monitoring data were grouped into two main categories, including:

- Stormwater Quality Characterization and Research Activities;
- Stormwater Treatment Technology Pilot Study Activities.

The first category was developed to address regulatory compliance, statistical evaluation, local modeling, and to collect data for research and development. The second category involves treatment technology effectiveness evaluations.

The 2002-03 data were collected at 126 different sites throughout California, spanning all twelve Caltrans districts and all nine Regional Water Quality Control Boards. Water quality and sediment samples were analyzed for a variety of constituents, classified as conventionals, hydrocarbons, anions & cations, metals, microbiologicals, nutrients, pesticides, and semi-volatile organic compounds. Some water quality samples were also evaluated for their toxicity to sensitive aquatic species. Sediment samples were also analyzed to assess various physical parameters. Small particle characterization and grain size distribution data were reported for some water quality and sediment samples, respectively. Finally, litter data were reported from the Phase II & III Gross Solids Removal Devices pilot study.

In this report, data are organized by individual characterization activity and summarized by observed range, mean, standard deviation, number of samples, and percent detected data. For detailed information on the various studies and activities, as well as any analyses of the data, refer to corresponding draft, interim, or final monitoring reports on file with Caltrans and listed in the body and references section of this report. Sites included in this year's summary report are listed, with descriptive fields, in Appendix A. All appendices are included in the attached compact disc.

## SECTION 2. ORGANIZATION

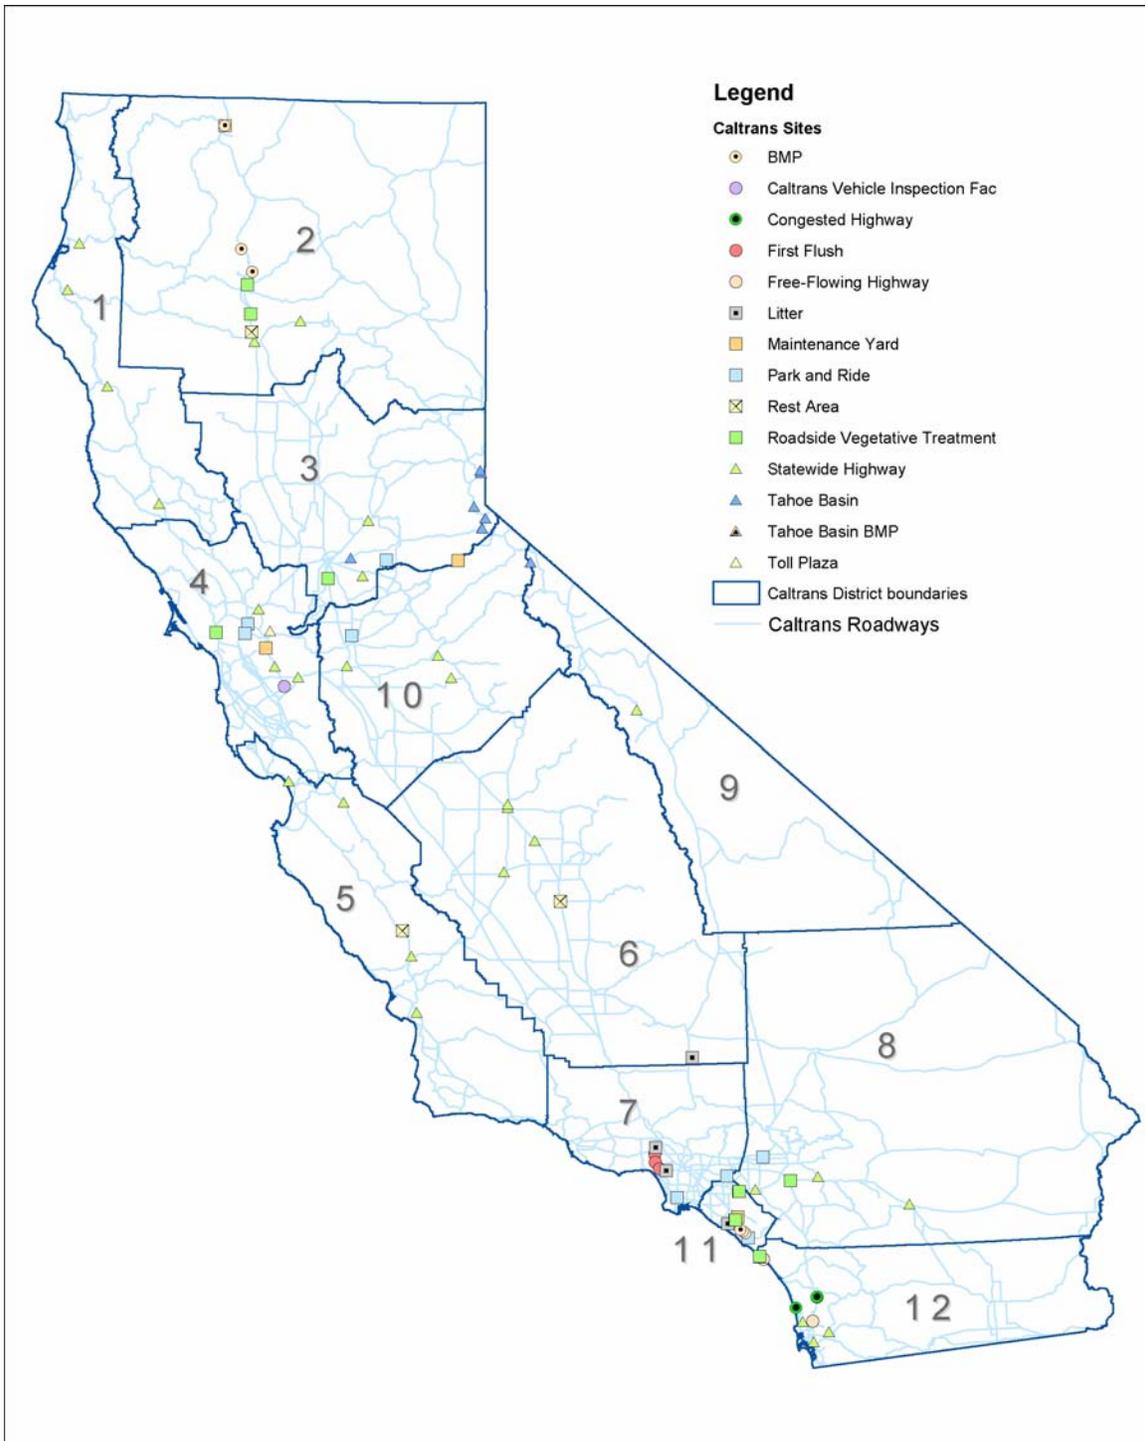

---

The data are organized into two major Caltrans characterization activities: Stormwater Quality Characterization and Research, and Stormwater Treatment Technology Pilot Study Activities. These activity groups each may include the collection of several types of data (e.g., water quality, sediment, litter and aquatic toxicity) collected for several different monitoring studies.

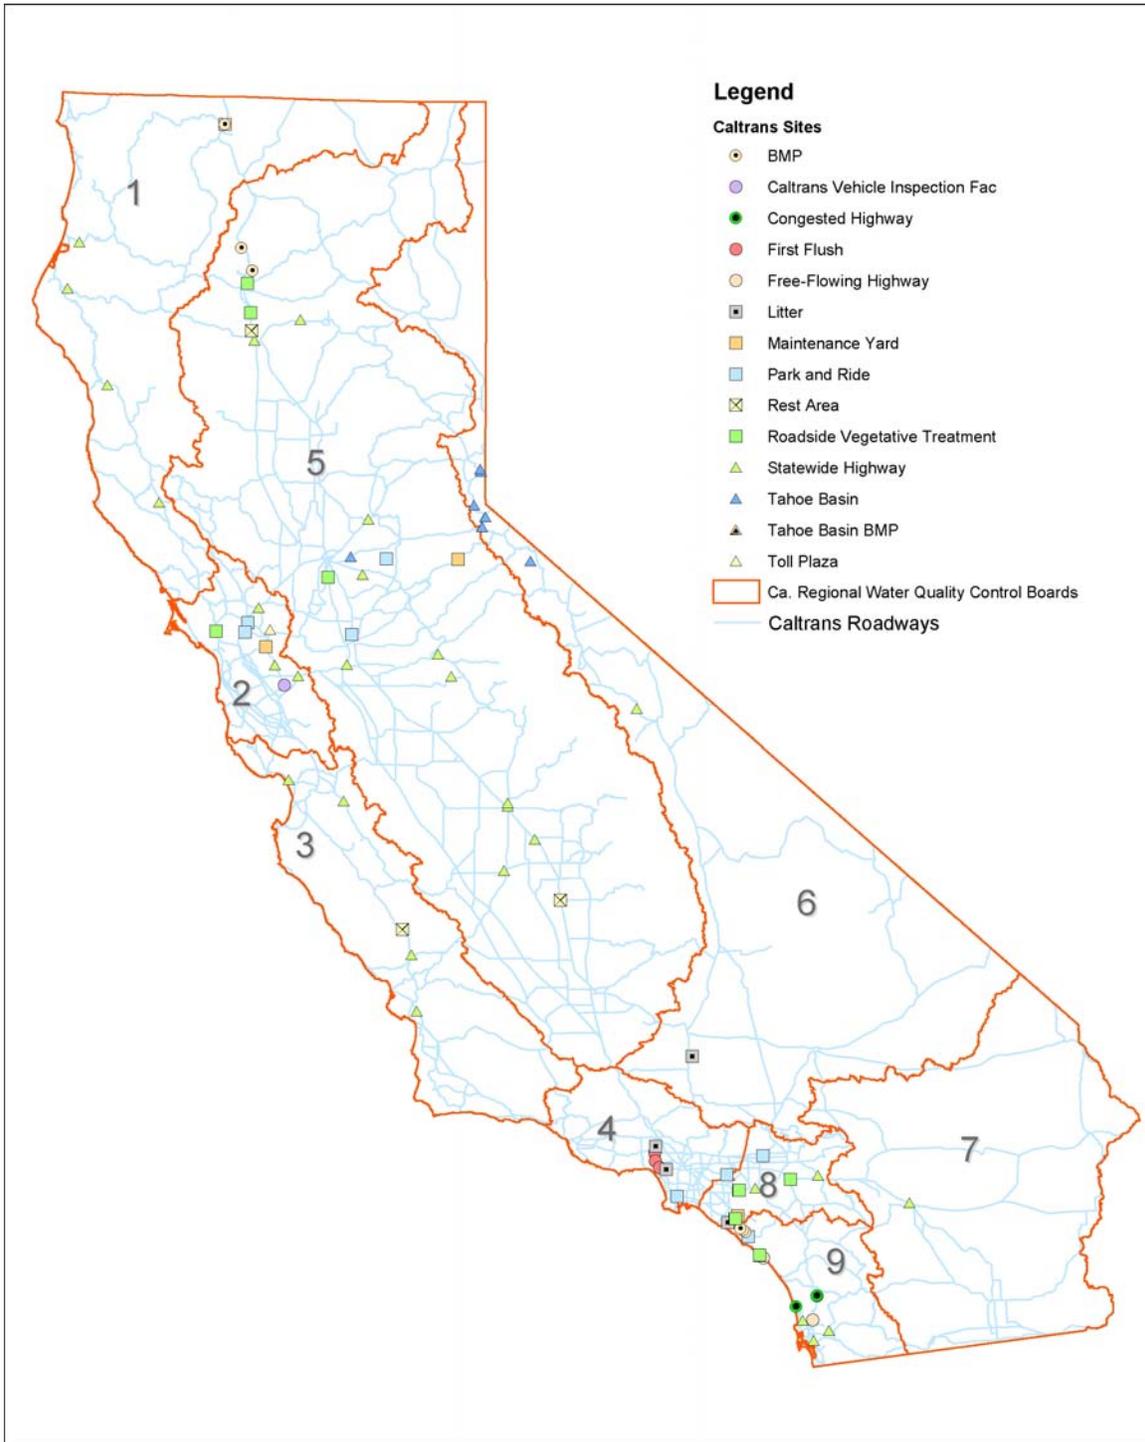

Data-reporting activities and their associated study names for 2002-03 are listed in Table 1. The monitoring sites are shown in Figures 1 and 2.

**Table 1. 2002-03 Data-Reporting Activities**

Category	Study Name
<i>Stormwater Quality Characterization and Research Activities</i>	
I. Statewide Characterization Activities	
	Congested & Free-Flowing Highway Runoff Characterization
	Caltrans Vehicle Inspection Facility (CVIF) Runoff Characterization
	Statewide Highway Runoff Characterization
	Maintenance Yard Runoff Characterization
	Park & Ride Runoff Characterization
	Rest Area Runoff Characterization
	Toll Plaza Characterization
	Tahoe Basin Runoff Characterization
	Tahoe Basin Sediment and Small Particle Characterization
II. Specialized Characterization Activities	
	Comprehensive Highway Runoff Characterization
	First Flush Characterization Study: UCLA
	Phase II & III Gross Solids Removal Devices Pilot Study
	Roadside Vegetative Treatment Site Study - WQ
	Roadside Vegetative Treatment Site Study - Sediment
	Statewide Aquatic Toxicity Study

	Compost Stormwater Filter System Monitoring - SR-73 Pilot Study
	Sand Media Filter Effectiveness Pilot Study
	Tahoe Basin Sand Trap Effectiveness Pilot Study

**Figure 1. 2002-03 Caltrans Monitoring Site Map - Caltrans Districts**

**Figure 2. 2002-03 Caltrans Monitoring Site Map - RWQCB Regions**

## **SECTION 3. STORMWATER QUALITY CHARACTERIZATION AND RESEARCH ACTIVITIES**

---

Stormwater quality and research activity data are organized into two categories: statewide characterization activities and specialized characterization activities. Statewide characterization activities include the collection, analysis and reporting of water quality and sediment data, while specialized characterization activities include the collection, analysis and reporting of water quality, sediment, litter and aquatic toxicity data.

Water quality and sediment monitoring sites and results for all sites within each activity are summarized by constituent, range, mean, standard deviation, number of samples, and percent detected data in Tables 2 through 39.

### **STATEWIDE CHARACTERIZATION ACTIVITIES**

The Statewide Stormwater Runoff Characterization Study is a multi-year study designed to characterize the quality of stormwater runoff from representative Caltrans facilities. Monitoring sites were selected to represent typical Caltrans operations in all Caltrans Districts. Statewide characterization activities include the monitoring of runoff from the following Caltrans facility types:

- congested and free-flowing highways,
- Caltrans vehicle inspection facilities (CVIFs),
- highways,
- maintenance yards,
- park & ride areas,
- rest areas, and
- toll plazas.

The selection of monitoring site locations was based on a variety of geographic, climatic, ecologic, and hydrologic factors that can potentially affect the quality of stormwater discharges. Highway sites were also selected based on their Average Annual Daily Traffic (AADT), in order to collectively monitor highway facilities experiencing a range of traffic use conditions in the State.

Statewide characterization activities also include the Tahoe Basin Runoff Characterization study, which monitored stormwater, snowmelt, and precipitation (including snowfall and rainfall) in 2002-03, and the three-year Tahoe Basin Sediment Characterization study. Monitoring sites and results for all statewide characterization activities are summarized in Tables 2 through 26.

## ***Congested/Free-Flowing Highway Runoff Characterization***

Runoff from two congested and two free-flowing highway sites was sampled to assess potential differences in water quality discharged from highway facilities having congested traffic and free-flowing traffic. Congested and free-flowing highway sites for which runoff characterization data were reported are listed in Table 2. A summary of the data collected at these sites, listing constituent, observed range, mean, standard deviation, number of samples (n), and percent detected data is presented in Table 3. Congested and free-flowing highway runoff characterization data reported in 2002-03 are listed in Appendix B.1. For additional information related to project background and overview, methodology, results and data analysis, conclusions and summary, refer to *Caltrans Statewide Stormwater Runoff Characterization Study: Monitoring Season 2002-2003* [CTSW-RT-03-052] (Caltrans, 2003).

## ***Caltrans Vehicle Inspection Facility Runoff Characterization***

Caltrans vehicle inspection facility (CVIF) runoff was sampled as part of the Caltrans CVIF Runoff Characterization study. The sites for which CVIF runoff characterization data were reported are listed in Table 4. A summary of the data collected, listing constituent, observed range, mean, standard deviation, number of samples (n), and percent detected data is presented in Table 5. CVIF runoff characterization data reported in 2002-03 are listed in Appendix B.2. For additional information related to project background and overview, methodology, results and data analysis, conclusions and summary, refer to *Caltrans Statewide Stormwater Runoff Characterization Study: Monitoring Season 2002-2003* [CTSW-RT-03-052] (Caltrans, 2003).

## ***Statewide Highway Runoff Characterization***

Highway runoff was sampled in 2002-03 as part of the Caltrans Statewide Highway Runoff Characterization study. The 2002-03 highway runoff data have been divided into two groups: data from non-urban highways (annual average daily traffic < 30,000), and data from urban highways (annual average daily traffic > 30,000). Runoff was characterized from 30 highway sites, as listed in Table 6. A summary of the data collected, listing constituent, observed range, mean, standard deviation, number of samples (n), and percent detected data is presented in Table 7. Statewide highway characterization data reported in 2002-03 are listed in Appendices B.3.a and B.3.b. For additional information related to project background and overview, methodology, results and data analysis, conclusions and summary, refer to *Caltrans Statewide Stormwater Runoff Characterization Study: Monitoring Season 2002-2003* [CTSW-RT-03-052] (Caltrans, 2003).

## ***Maintenance Yard Runoff Characterization***

Maintenance yard runoff was sampled from three Caltrans maintenance yard sites. These sites are listed in Table 8. A summary of the data collected, listing constituent, observed range, mean, standard deviation, number of samples (n), and percent detected data is presented in Table 9. Maintenance yard characterization data reported in 2002-03 are listed in Appendix B.4. For additional information related to project background and overview, methodology, results and data analysis, conclusions and summary, refer to *Caltrans Statewide Stormwater Runoff Characterization Study: Monitoring Season 2002-2003* [CTSW-RT-03-052] (Caltrans, 2003).

## ***Park & Ride Runoff Characterization***

Park & ride runoff was sampled from eight Caltrans park & ride runoff sites. These sites are listed in Table 10. A summary of the data collected, listing constituent, observed range, mean, standard deviation, number of samples (n), and percent detected data is presented in Table 11. Park & ride runoff characterization data reported in 2002-03 are listed in Appendix B.5. For additional information related to project background and overview, methodology, results and data analysis, conclusions and summary, refer to *Caltrans Statewide Stormwater Runoff Characterization Study: Monitoring Season 2002-2003* [CTSW-RT-03-052] (Caltrans, 2003).

### ***Rest Area Runoff Characterization***

Rest area runoff was sampled as part of the Caltrans Rest Area Runoff Characterization study. The sites for which rest area runoff characterization data were reported are listed in Table 12. A summary of the data collected, listing constituent, observed range, mean, standard deviation, number of samples (n), and percent detected data is presented in Table 13. Rest area runoff characterization data reported in 2002-03 are listed in Appendix B.6. For additional information related to project background and overview, methodology, results and data analysis, conclusions and summary, refer to *Caltrans Statewide Stormwater Runoff Characterization Study: Monitoring Season 2002-2003* [CTSW-RT-03-052] (Caltrans, 2003).

## ***Tahoe Basin Runoff Characterization***

The 2002-2003 stormwater monitoring season represented the final year of a three-year monitoring effort in the Lake Tahoe Basin. This monitoring effort was designed to (1) assess highway runoff water quality in the Tahoe area; (2) assess the effectiveness of double-barrel sand traps to reduce pollutants in highway runoff and to retain sediments transported in runoff; (3) characterize the concentration of fine particles ( $\leq 200$  microns) transported in highway runoff; and (4) assess precipitation quality and evaluate the relative contribution of precipitation to pollutant concentrations found in Tahoe area highway runoff.

During the 2002-03 Tahoe Basin Highway Runoff Characterization study, stormwater runoff, snow melt runoff, and precipitation (snowfall and rainwater) samples were collected to assess highway runoff and precipitation quality. The sites for which Tahoe Basin runoff and precipitation data were reported are listed in Table 16. Summaries of the water quality data collected, listing constituent, observed range, mean, standard deviation, number of samples (n), and percent detected are presented in Tables 17 (stormwater), 18 (snow melt), and 19 (precipitation). Tahoe Basin water characterization data reported in 2002-03 are listed in Appendices B.8.a through B.8.c. For additional information related to project background and overview, methodology, results and data analysis, conclusions and summary, refer to *Caltrans Tahoe Highway Runoff Characterization and Sand Trap Effectiveness Studies: 2002-2003 Monitoring Report* [CTSW-RT-03-054.36.02] (Caltrans, 2003).

## ***Tahoe Basin Sediment and Small Particle Characterization***

The 2002-2003 stormwater monitoring season represented the final year of a three-year monitoring effort in the Lake Tahoe Basin. This monitoring effort was designed to (1) assess highway runoff water quality in the Tahoe area; (2) assess the effectiveness of double-barrel sand traps to reduce pollutants in highway runoff and to retain sediments transported in runoff; (3) characterize the concentration of fine particles ( $\leq 200$  microns) transported in highway runoff; and (4) assess precipitation quality and evaluate the relative contribution of precipitation to pollutant concentrations found in Tahoe area highway runoff.

Sediment and particle samples from the Tahoe Basin were collected during the three-year study, from 2000 through 2003, to characterize the sediment retained by double-barrel sand traps (DBST) and particles discharged from the traps in terms of grain size and chemical content. The sites for which Tahoe Basin sediment and particle data were reported are listed in Table 20. Summaries of the sediment data collected at the sites each year, listing constituent, grain size fraction, observed range, mean, standard deviation, number of samples (n), and percent detected data for each monitoring year are presented in Tables 21 through 23. Summaries of the particle size and particle count data collected at the sites during each monitoring year are presented in Tables 24 through 26.

Tahoe Basin sediment characterization data reported during the three years of the study are listed in Appendices B.9.a through B.9.c. Tahoe Basin particle size and particle count data reported during the three years of the study are listed in Appendices B.10.a through B.10.c. For additional information related to project background and overview, methodology, results and data analysis, conclusions and summary, refer to *Caltrans Tahoe Highway Runoff Characterization and Sand Trap Effectiveness Studies: 2002-2003 Monitoring Report* [CTSW-RT-03-054.36.02] (Caltrans, 2003).

## SPECIALIZED CHARACTERIZATION ACTIVITIES

Specialized characterization activities performed during 2002-03 included a post-season comprehensive highway runoff characterization analysis, a stormwater first flush study, a Gross Solids Removal Devices (GSRD) pilot study, a roadside vegetative treatment site study of water quality and sediment, and an aquatic toxicity study. The comprehensive highway runoff characterization included a post-season data compilation and subsequent generation of summary statistics for all highway runoff data collected from all Caltrans monitoring studies during 2002-03. The ongoing first flush study attempted to identify the first flush phenomenon within a storm, and the GSRD pilot study continued to measure the influence of a variety of litter management techniques on litter loads. During the Roadside Vegetative Treatment Site study, stormwater runoff was monitored at biofiltration strip inlets and outlets, and sediment was monitored at the outlets. A group of 40 Caltrans Statewide monitoring sites collectively showing a range of physical and traffic-related characteristics were selected for toxicity monitoring during the three-year Aquatic Toxicity study. Monitoring data for all sites monitored under the auspices of specialized characterization activities are summarized in Tables 27 through 45.

### *Comprehensive Highway Runoff Characterization*

The monitoring of stormwater discharges from Caltrans highway facilities was conducted by a number of monitoring studies in addition to the Statewide Stormwater Runoff Characterization Study. These additional highway runoff data augment data collected by the Statewide study to further expand the scope of the Caltrans highway runoff characterization data set. Highway runoff data from six monitoring studies were compiled to produce the 2002-03 comprehensive highway runoff data set.

As with the Statewide Highway Runoff Characterization, data were divided into two groups: data from non-urban highways (AADT  $\leq$  30,000), and data from urban highways (AADT  $>$  30,000). Runoff data collected from 55 highway sites were characterized, as listed in Table 27. A summary of the data collected from these sites, listing constituent, observed range, mean, standard deviation, number of samples (n), and percent detected data is presented in Table 28. Non-statewide highway characterization data reported in 2002-03 are listed in Appendices C.1.a and C.1.b. Statewide highway characterization data reported in 2002-03 are listed in Appendices B.3.a and B.3.b, as described in the previous Statewide Highway Runoff Characterization study section.

[1] This highway runoff data summary includes Statewide Highway Runoff Characterization study data as well as any other water quality data collected from Caltrans highway facilities.

## ***First Flush Characterization Study***

In 1999-00, Caltrans initiated a storm water first flush characterization study. The purpose of this study is to determine both the seasonal and storm-specific first flush effects. In 2002-03, the University of California at Los Angeles (UCLA) performed a first flush study in the Los Angeles area. The goal of the study was to characterize first flush phenomena by monitoring entire storm events.

The sites for which first flush characterization data were reported are listed in Table 29. First flush and discrete grab sample data are summarized in Table 30. A summary of the first flush water quality data collected, listing constituent, observed range, mean, standard deviation, number of samples (n), and percent detected data for the study is presented in Table 31. A summary of the whole storm composite data collected at the first flush sites during the 2002-03 study is presented in Table 32. First Flush Characterization study data are listed in Appendices C.2.a through C.2.c. A comprehensive analysis and evaluation of the first flush stormwater runoff characterization data will be performed and a final report will be prepared by December 30, 2003.

## ***Phase II & III Gross Solids Removal Devices Pilot Study***

Litter is gradually being considered as a major pollutant in stormwater runoff for some watersheds, and is thought to adversely affect the beneficial uses of receiving waters. Caltrans initiated a number of litter characterization studies during the past several years as part of their litter management program. The objective of the Gross Solids Removal Devices (GSRD) pilot study is to evaluate selected devices that can be incorporated into existing or future highway drainage systems to capture litter and incidental coarse solids, collectively described as gross solids.

During the 2002-03 monitoring season, litter characterization activities continued under the Phase II & III GSRD pilot study. The purpose of these phases of the study were to (1) characterize the amount of gross solids captured by four distinct litter removal devices (forward sloping V screen, inclined screen, reverse sloping V screen, and GSRD with sediment trap), and (2) assess the effectiveness of these devices in reducing gross solids from highway runoff. The sites for which litter characterization data were reported are listed in Table 33. Table 34 presents litter-related summary data, listing weight and volume for each litter-related category. In the tabular results presented, "Gross Solids" refers to co-mingled litter and vegetation, as well as any dirt or other material that may be captured by the device. Litter study data are listed in Appendix C.3. Additional information related to project background and overview, methodology, results and data analysis, conclusions and summary will be included in the study's final report scheduled for publication in Fall 2003.

**Table 33. 2002-03 Phase II & III Gross Solids Removal Devices Site List**

Reverse Sloping V Screen	7-239	0.8	138.34	318
Gross Solids Removal Device with Sediment Trap	12-260	1.4	507.84	760

## ***Roadside Vegetative Treatment Site Study – Water Quality***

The Roadside Vegetated Treatment Sites (RVTS) Study is a 2-year water quality monitoring project undertaken to evaluate the effectiveness of existing vegetated slopes adjacent to freeways at removing storm water contaminants. The monitoring period encompassed two wet seasons, generally from October to April 2001-2002 and 2002-2003. The RVTS test sites are located in Sacramento, Redding, Cottonwood, San Rafael, Yorba Linda, Irvine, San Onofre, and Moreno Valley.

The objectives of this study were to determine if standard roadway design requirements result in biofilter strips with treatment equivalent to those specifically engineered for water quality performance and to generate design criteria. Variables such as length, slope, vegetation density, and hydraulic loading were evaluated by studying the runoff through existing vegetated slopes at four locations in northern California and four locations in southern California. At each location, concrete channels approximately 30 m long were constructed to capture freeway runoff after it passed through existing biofilter strips of varying lengths. The quantity and quality of the runoff in the biofilter strip was compared to freeway runoff collected at the edge of the pavement.

The sites for which biofiltration strip runoff data were reported in 2002-03 are listed in Table 35. Data from each inlet is associated with data from several outlets, collected at different locations along the biofiltration strips. Summaries of the data collected at each strip are presented in Tables 36 through 43. The summaries list constituent, observed range, mean, number of samples (n), and percent detected data at each inlet and the associated outlets. All data collected from the monitoring study were used when generating the summary statistics included in Tables 36 through 43. Roadside Vegetative Treatment Site water quality data reported in 2002-03 are listed in Appendices C.4.a and C.4.b. The study has been completed and is currently in draft report stage. For further information, refer to the draft report *Roadside Vegetated Treatment Sites (RVTS) Study* (Caltrans, 2003). Completion of the final report is expected in the fall of 2003.

## ***Roadside Vegetative Treatment Site Study – Sediment***

During the 2002-03 Roadside Vegetative Treatment Site study, sediment samples were collected at biofiltration strip outlets. The sites for which biofiltration strip sediment data were reported in 2002-03 are listed in Table 44. Data from each outlet were collected at different locations along the biofiltration strips. The grain size fraction for all constituents was “entire.” Roadside Vegetative Treatment Site sediment study data reported in 2002-03 are listed in Appendix C.4.c.

## *Aquatic Toxicity Study*

The objective of three-year aquatic toxicity study was to enable Caltrans to assess the toxicity associated with its storm drain system discharges relative to California Toxic Rule constituents and Caltrans facilities and practices, and provide some understanding of the basis of the toxicity. The University of California at Davis performed toxicity bioassays on water samples collected at 40 Caltrans sites. A range of site types were selected for toxicity testing over the three year study, including one free-flowing highway site, four maintenance yard sites, eight park & ride sites, three rest area sites, and twenty-four highway sites. The sites for which aquatic toxicity test data were reported are listed in Table 45. The toxicity study data reported during the three years of the study is listed in Appendices C.5.a through C.5.c.

### SUMMARY OF AQUATIC TOXICITY RESULTS

#### *Methods of Statistical Analysis*

Toxicity was defined as a statistically significant difference ( $p < 0.05$ ) between a sample and the laboratory control water. Acute toxicity in the Ceriodaphnia and Pimephales assays was defined as a statistically significant increase in mortality in a test sample when compared to the laboratory control within 96 hours. Chronic toxicity was defined as a significant increase in mortality compared to the laboratory control in greater than 96 hours or a significant decrease in growth or reproduction compared to the laboratory control.

All Ceriodaphnia reproduction, Pimephales biomass and mortality, and Selenastrum growth data were analyzed with Bartlett's Test for homogeneity of variance. When the data showed homogeneous variance, it was analyzed using an Analysis of Variance and Dunnett's mean separation tests. When the data showed heterogeneous variance, it was transformed to relative ranks then analyzed using an Analysis of Variance and Dunnett's mean separation test. Ceriodaphnia mortality was analyzed with Fisher's Exact Test. No statistical analysis was performed on Toxicity Identification Evaluation (TIE) results.

#### *Monitoring Year 2000-2001*

Thirty-eight sites were selected for toxicity monitoring, including three rest areas, four maintenance yards, 23 highway storm drains, and eight park-and-ride sites. Because of variability in rainfall, not all sites were sampled during each storm event, and sites in the southern part of the state did not experience sufficient rainfall to be sampled across the entire wet season. At least one toxicity test during one sample period was significantly different from the control (indicating toxicity) at all but two sites. An additional seven sites had sampling dates with

no toxicity for any test. Of the three types of test, the Pimephales test resulted in the greatest number of positive test results (significant toxicity) while the Selenastrum resulted in the smallest. TIEs were performed on all samples for which acute toxicity was observed. The TIEs indicated that no single source of toxicity was common among sites. Non-polar organic compounds were suggested as the putative source of toxicity in three of the 96-hour Pimephales TIEs and metals were suggested as the putative source in four TIEs. In twelve cases, no source of toxicity could be identified, and in one case, both a non-polar organic and a metal were suggested as the putative causes. In three TIEs, the putative cause was listed as a metabolically activated pesticide. The pesticide was listed for highway sites, park-and-rides, and maintenance yards, indicating no pattern in the distribution of potential pesticide sites.

#### *Monitoring Year 2001-2002*

Toxicity tests for the Caltrans year 2001-2002 were performed at the same sites as the previous year, 2000-2001, with the exception of two sites that were replaced. The same number of different types of sites were sampled. Three rain events were sampled at most monitoring sites to reflect the early season flush, the mid-season, and end-of-season storm events. Suspected toxicants included metabolically activated pesticides, metals, non-polar organics, and surfactants. The same general groups of contaminants were responsible for toxicity in 2001-2002 as in 2000-2001. However, no non-polar organics were suggested as potential causes of toxicity, and surfactants were a common putative cause. Metals were the putative cause of toxicity in almost 24% of the TIEs.

#### *Monitoring Year 2002-2003*

During monitoring year 2002-2003, only sites that repeatedly showed toxicity in previous years were selected for monitoring. This narrowed down the number of sites to 17, including three maintenance yards, 10 highway storm drains and four park-and-ride sites. Sites were sampled during two events to catch the first flush and mid-season rain events. Initial Pimephales screenings had the highest number of significant results. Surfactants were suspected as possible toxicants for all types of facilities and were usually considered to be partially responsible, as well as either non-polar organics or metals. TIEs were performed at eleven sites during Event 1. Three TIEs performed on water collected from different highway sites were inconclusive. Of the remaining TIEs performed, three suggested that more than one toxicant was partially responsible, two suggested metals as the putative source, and two suggested surfactants as the putative source. There appeared to be no pattern between facility sites and putative source of toxicity. Phase II TIEs were performed on 11 sites between the two storm events sampled. This was the only year in which Phase II TIEs were performed on samples that had non-polar organics as suspected toxicants. Water

chemistry analyses are currently being conducted on the water from the Phase II toxicity tests and should be available in the near future. These data will be included in the final report.

#### *Yearly Toxicity Trends*

During the 2000-2001 monitoring season, TIEs found metals, metabolically activated pesticides, and non-polar organics as the major putative sources of toxicity. During the 2001-2002 monitoring season, surfactants also became suspected toxicants and metals were most commonly seen as the putative source of toxicity. During the 2002-2003 monitoring season, no metabolically activated pesticides were suspected and the most common source of toxicity was a combination of non-polar organics and surfactants. There does not appear to be a common source of toxicity throughout the three-year monitoring study, nor is there a trend between sites. There does not appear to be a trend in the type of land use category that exhibited toxicity, nor in the cause of the toxicity. The type of surface from which stormwater samples were collected also did not appear to affect the results.

Correlation analyses indicate that long antecedent dry periods, large amounts of impervious surface, high traffic volume (where appropriate), and large catchment areas lead to increased toxicity, although the results are not always statistically significant.

## SECTION 4. STORMWATER TREATMENT TECHNOLOGY PILOT STUDY ACTIVITIES

---

Stormwater treatment technology pilot study activities in 2002-03 consisted of studies evaluating various new treatment technologies (pilot studies) for stormwater runoff related to Caltrans facilities. Inlet data from some pilot study sites are also included in the Comprehensive Highway Runoff Characterization summary and the Tahoe Basin Runoff Characterization summary. New treatment technologies monitored this year include compost stormwater filters (CFS), sand media filters, and double-barrel sand traps. The data collected from sites monitored within each of these studies are summarized by constituent, range, mean, standard deviation, number of samples (n), and percent detected data in Tables 46 through 56.

### COMPOST STORMWATER FILTER SYSTEM MONITORING – STATE ROUTE 73 PILOT STUDY

Caltrans completed its second year of the Compost Stormwater Filter System Monitoring – State Route 73 pilot study. This study consists of an ongoing effort to (1) determine the quality of stormwater runoff from the San Joaquin Hills Transportation Corridor (State Route 73); (2) determine the effectiveness of compost stormwater filter (CFS) units and flow equalization basins in removing pollutants of concern from runoff from State Route 73; (3) determine if the CSF units are contributing nutrients; and (4) if the CSF units are contributing nutrients, whether this is causing impairment of water quality and beneficial uses of receiving waters associated with State Route 73.

The compost stormwater filter system consists of a treatment chain that includes one to three equalization basins, a filter-inlet, a filter-outlet, and a bypass where treated water may overflow. During the 2002-03 CSF study, stormwater runoff was monitored at three CFS sites that collectively provided water quality samples from six equalization basins, including three filter-inlets, three filter-outlets, and one overflow site, as listed in Table 46. A summary of the data collected in 2002-03 is presented in Table 47. The summary lists constituent, observed range, mean, standard deviation, number of samples (n), and percent detected data at the equalization basins, inlets, and outlets and the overflow site. Compost Stormwater Filter System Monitoring – State Route 73 pilot study data reported in 2002-03 are listed in Appendices D.1.a through D.1.c. For additional information related to project background and overview, methodology, results and data analysis, conclusions and summary, refer to *Compost Stormwater Filter System Monitoring – State Route 73* [CTSW-RT-03-036] (Caltrans, 2003).

## SAND MEDIA FILTER EFFECTIVENESS PILOT STUDY

The District 2 Sand Filter pilot study is being performed to determine how cold climates, different sedimentation basin designs, and earthen construction affects pollutant removal performance and cost. The two sand filters are located in areas with relatively large amounts of rainfall and where freezing temperatures occur. In contrast to the Southern California retrofit pilot projects, these two sand filters are based on inexpensive designs such as earthen basins. The Mountain Gate sand filter was constructed as a combined sedimentation and filtration basin. The Shasta Maintenance Station sand filter was constructed with a separate sedimentation basin, like the Southern California sand filters.

During the 2002-03 Sand Filter pilot study, stormwater and snowmelt runoff was monitored at sand media filter inlets and outlets. The sites for which sand media filter runoff data were reported in 2002-03 are listed in Table 48. A summary of the stormwater data collected at each sand filter is presented in Tables 49 and 50. Only one snow melt event was monitored in 2002-03, and a summary of that data is presented in Table 51. The summaries list constituent, observed range, mean, standard deviation, number of samples (n), and percent detected data at the inlets and outlets. Sand Media Filter Effectiveness study stormwater data reported in 2002-03 are listed in Appendices D.2.a and D.2.b. Snow melt data are listed in Appendices D.2.c and D.2.d.

## TAHOE BASIN SAND TRAP EFFECTIVENESS PILOT STUDY

The 2002-2003 stormwater monitoring season represented the final year of a three-year monitoring effort in the Lake Tahoe Basin. This monitoring effort was designed to (1) assess highway runoff water quality in the Tahoe area; (2) assess the effectiveness of double-barrel sand traps to reduce pollutants in highway runoff and to retain sediments transported with the runoff; (3) characterize the concentration of fine particles ( $\leq 200$  microns) transported in highway runoff; and (4) assess precipitation quality and evaluate the relative contribution of precipitation to pollutant concentrations found in Tahoe area highway runoff .

During the 2002-03 Tahoe Basin Sand Trap Effectiveness pilot study, stormwater runoff and snow melt were monitored at double-barrel sand trap (DBST) inlets and outlets to assess the effectiveness of DBSTs to reduce constituent concentrations in highway runoff and to retain sediments transported with the runoff. The sites for which DBST runoff data were reported in 2002-03 are listed in Table 52. A summary of the stormwater quality data collected in 2002-03 is presented in Table 53, while a summary of the snow melt water quality data is presented in Table 54. These summaries list constituent, observed range, mean, standard deviation, number of samples (n), and percent detected data at the inlets and outlets. Tables 55 and 56 present small particle size distribution data (reported as particle count fraction) collected at these sites during the 2001-02 and 2002-03 monitoring seasons.

Inlet water quality data were also presented in the Tahoe Basin Runoff Characterization study data summary. Inlet particle count fraction data were also presented in the 2001-02 and 2002-03 Tahoe Basin Sediment and Small Particle Characterization study data summaries. Tahoe Basin Sand Trap Effectiveness pilot study stormwater and snow melt data reported in 2002-03 are listed in Appendices D.3.a through D.3.d. Particle count fraction data are listed in Appendices D.4.a through D.4.d. For additional information related to project background and overview, methodology, results and data analysis, conclusions and summary, refer to Caltrans Tahoe Highway Runoff Characterization and Sand Trap Effectiveness Studies: 2002-03 Monitoring Report [CTSW-RT-03-054.36.02] (Caltrans, 2003).

## 2002-2003 Monitoring Sites

Monitoring Site ID	Study Name	Site Name	Site Description	Latitude	Longitude	Data Provider
1-34	Statewide Highway Runoff Characterization	299E - Humboldt Co. - Dist. 1	Rolling forested hills	40.88748	123.975	Geomatrix
1-35	Statewide Highway Runoff Characterization	36E - Humboldt Co. - Dist. 1	Rolling forested hills	40.53875	124.07225	Geomatrix
1-36	Statewide Highway Runoff Characterization	101N - Mendocino Co. - Dist. 1	Rolling forested hills	39.83203	123.65002	Geomatrix
1-39	Statewide Highway Runoff Characterization	175S - Mendocino County	Site 1-39 is located on SR 175 west of the community of Old Hopland.	38.9713	123.1136	MAC Tech
2-01	Statewide Highway Runoff Characterization	36N - Tehama County	Site 2-1 is a section of 36W approximately 500 feet long at an elevation of 3,000 feet	40.3574	121.795	MAC Tech
2-02	Statewide Highway Runoff Characterization	5N - Tehama County	Site 2-2 is located on the east side of Interstate 5 just off the shoulder	40.1955	122.2372	MAC Tech
2-03	Rest Area Runoff Characterization	Herbert S. Miles Rest Area	Site 2-3 is a rest area with planter boxes and restrooms	40.2702	122.2697	MAC Tech
2-201	Additional Highway Runoff Characterization, Roadside Vegetative Treatment Site Study	Cottonwood 1	I-5-SB at the Cottonwood exit	40.4034	122.2807	URS
2-202	Roadside Vegetative Treatment Site Study	Cottonwood 2	V-ditch 9.3 m from edge of pavement	40.4034	122.2807	URS
2-203	Additional Highway Runoff Characterization, Roadside Vegetative Treatment Site Study	299 1	SR-299-EB between Churn Creek Rd. and Old Oregon Trail/Shasta College exits	40.6202	122.32	URS
2-204	Roadside Vegetative Treatment Site Study	299 2	V-ditch 2.2 m from edge of pavement	40.6202	122.32	URS
2-205	Roadside Vegetative Treatment Site Study	299 3	V-ditch 4.2 m from edge of pavement	40.6202	122.32	URS
2-206	Roadside Vegetative Treatment Site Study	299 4	V-ditch 6.2 m from edge of pavement	40.6202	122.32	URS
2-207	Additional Highway Runoff Characterization, Sand Media Filter	Mountain Gate Northbound Influent	Partial Sedimentation Austin Sand Filter Adjacent to I-5 NB	35.08658	137.55778	Geomatrix
2-208	Sand Media Filter	Mountain Gate Effluent	Partial Sedimentation Austin Sand Filter Adjacent to I-5 NB	35.08581	137.55783	Geomatrix

## 2002-2003 Monitoring Sites

Monitoring Site ID	Study Name	Site Name	Site Description	Latitude	Longitude	Data Provider
2-209	Maintenance Yard Runoff Characterization, Sand Media Filter	Shasta Influent	Full Sedimentation Austin Sand Filter at Mt Shasta Maintenance Station; 1625 Mott Road, Mt Shasta CA, 96067	35.62401	137.62413	Geomatrix
2-210	Sand Media Filter	Shasta Effluent	Full Sedimentation Austin Sand Filter Mt Shasta Maintenance Station; 1625 Mott Road, Mt Shasta CA, 96067	35.62363	137.62426	Geomatrix
2-211	Additional Highway Runoff Characterization, Sand Media Filter	Mountain Gate Southbound Influent	Partial Sedimentation Austin Sand Filter Adjacent to I-5 NB	35.08691	137.55782	Geomatrix
3-04	Park & Ride Runoff Characterization	Statewide - Shingle Springs Park and Ride	North of Shingle Springs Exit, south of Rock Barn Rd; commerical site within the foothills.	38.58647	120.9389	CDM
3-06	Statewide Highway Runoff Characterization	Statewide - 80E near Hwy 193	East of Ophir Road Exit of Interstate 80, South of Ophir Road; rural site within the foothills.	38.87928	121.1167	CDM
3-07	Statewide Highway Runoff Characterization, Tahoe Basin Sediment Characterization	Statewide - Hwy 50W near Zinfandel Drive	North of Highway 50, south of Olson Drive; commercial site.	38.59772	121.2787	CDM
3-08	Maintenance Yard Runoff Characterization	Statewide - Sunrise Maintenance Yard	East of Sunrise Blvd, north of Sanders Drive; commerical site.	38.58647	120.2605	CDM
3-201	Additional Highway Runoff Characterization, Tahoe Basin Water Quality & Sediment Characterization	Tahoe - 50W Tahoe Meadows	Highway 50 west bound at lake road; an urban site.	38.57139	119.56972	CDM
3-202	Additional Highway Runoff Characterization, Tahoe Basin Water Quality & Sediment Characterization	Tahoe - 50E Tahoe Airport (influent)	Highway 50 east bound 5 miles to South Lake Tahoe; a rural site.	38.89756	119.56972	CDM
3-203	Additional Highway Runoff Characterization, Tahoe Basin Water Quality Characterization	Tahoe - 50E Echo Summit (influent)	Highway 50 east bound 10 miles to South Lake Tahoe; a rural, high elevation site.	38.82858	120.03106	CDM
3-204	Tahoe Basin Sediment Characterization	Tahoe-89S (Down-gradient barrel)	Highway 89; north bound 10 miles to South Lake Tahoe; a rural, high elevation site.			CDM

## 2002-2003 Monitoring Sites

Monitoring Site ID	Study Name	Site Name	Site Description	Latitude	Longitude	Data Provider
3-205	Tahoe Basin Sediment Characterization	Tahoe-89S (Up-gradient barrel)	Highway 89; north bound 10 miles to South Lake Tahoe; a rural, high elevation site.			CDM
3-206	Tahoe Basin Sediment Characterization	Statewide - Hwy 50W near Zinfandel Drive (Filter Box)	North of Highway 50, south of Olson Drive; commercial site.	38.59772	121.2787	CDM
3-207	Tahoe Basin Sediment Characterization	Statewide - Hwy 50W near Zinfandel Drive (Pipe)	North of Highway 50, south of Olson Drive; commercial site.	38.59772	121.2787	CDM
3-213	Additional Highway Runoff Characterization, Roadside Vegetative Treatment Site Study	Sacramento 1	I-5-NB north of Laguna St. exit	38.44364	121.49072	URS
3-214	Roadside Vegetative Treatment Site Study	Sacramento 2	V-ditch 1.1 m from edge of pavement	38.44389	121.49075	URS
3-215	Roadside Vegetative Treatment Site Study	Sacramento 3	V-ditch 4.6 m from edge of pavement	38.44419	121.49078	URS
3-216	Roadside Vegetative Treatment Site Study	Sacramento 4	V-ditch 6.6 m from edge of pavement	38.44445	121.49081	URS
3-217	Roadside Vegetative Treatment Site Study	Sacramento 5	V-ditch 8.4 m from edge of pavement	38.44474	121.49085	URS
3-218	Additional Highway Runoff Characterization, Tahoe Basin Water Quality & Sediment Characterization	Tahoe - 89N D.L. Bliss State Park	Highway 89 north bound at northern boundry of D.L. Bliss State Park; a rural site.	38.98864	120.10878	CDM
3-219	Additional Highway Runoff Characterization, Tahoe Basin Water Quality & Sediment Characterization	Tahoe - 28W Snow Creek	Highway 28 west bound at Agatam Circle in Tahoe Vista; an urban site.	39.2393	120.04005	CDM
3-220	Additional Highway Runoff Characterization, Tahoe Basin Water Quality & Sediment Characterization	Tahoe - 267N Brockway Summit	Highway 267 north bound 5 miles from Kings Beach; a rural site.	39.25742	120.04705	CDM
3-222	Tahoe Basin Water Quality & Sediment Characterization, Double-Barrel Sand Trap	Tahoe - 50E Tahoe Airport (effluent)	Highway 50 east bound 5 miles to South Lake Tahoe; a rural site.	38.89756	119.56972	CDM

## 2002-2003 Monitoring Sites

Monitoring Site ID	Study Name	Site Name	Site Description	Latitude	Longitude	Data Provider
3-223	Tahoe Basin Water Quality & Sediment Characterization, Double-Barrel Sand Trap	Tahoe - 50E Echo Summit (effluent)	Highway 50 east bound 10 miles to South Lake Tahoe; a rural, high elevation site.	38.82858	120.03106	CDM
3-224	Statewide Highway Runoff Characterization	Statewide - Highway 65	North of Stanford Ranch Road offramp on Highway 65; a commercial site.	38.46572	121.16315	CDM
3-226	Tahoe Basin Sediment Characterization	Tahoe - 50E Tahoe Airport (Filter Box)	Highway 50 east bound 5 miles to South Lake Tahoe; a rural site.	38.89756	119.56972	CDM
3-227	Tahoe Basin Sediment Characterization	Tahoe - 50E Tahoe Airport (Up-gradient barrel)	Highway 50 east bound 5 miles to South Lake Tahoe; a rural site.	38.89756	119.56972	CDM
3-228	Tahoe Basin Sediment Characterization	Tahoe - 50E Tahoe Airport (Down-gradient barrel)	Highway 50 east bound 5 miles to South Lake Tahoe; a rural site.	38.89756	119.56972	CDM
3-230	Tahoe Basin Sediment Characterization	Tahoe - 50E Echo Summit (Filter Box)	Highway 50 east bound 10 miles to South Lake Tahoe; a rural, high elevation site.	38.82858	120.03106	CDM
3-231	Tahoe Basin Sediment Characterization	Tahoe - 50E Echo Summit (Up-gradient barrel)	Highway 50 east bound 10 miles to South Lake Tahoe; a rural, high elevation site.	38.82858	120.03106	CDM
3-232	Tahoe Basin Sediment Characterization	Tahoe - 50E Echo Summit (Down-gradient barrel)	Highway 50 east bound 10 miles to South Lake Tahoe; a rural, high elevation site.	38.82858	120.03106	CDM
3-233	Tahoe Basin Sediment Characterization	Tahoe - 50E Echo Summit (Pipe)	Highway 50 east bound 10 miles to South Lake Tahoe; a rural, high elevation site.	38.82858	120.03106	CDM
4-211	Toll Plaza Runoff Characterization	Benicia Bridge Toll Plaza	Site 4-211 is located just south of the Benicia Bridge toll plaza along the Plaza Service Road	38.0454	122.0289	MAC Tech
4-212	CVIF Runoff Characterization	Mission Grade	Site 4-212 is located within the Mission Grade Vehicle Inspection Facility	37.6375	121.8844	MAC Tech
4-213	Additional Highway Runoff Characterization, Roadside Vegetative Treatment Site Study	San Rafael 1	SR-101-NB north of Lucas Valley Road exit	38.02611	122.53778	URS
4-214	Roadside Vegetative Treatment Site Study	San Rafael 2	V-ditch 8.3 m from edge of pavement	38.02552	122.53778	URS

## 2002-2003 Monitoring Sites

Monitoring Site ID	Study Name	Site Name	Site Description	Latitude	Longitude	Data Provider
4-34	Park & Ride Runoff Characterization	Lemon Street North Park and Ride	Site 4-34 is located on Lemon Street, west of Interstate 80 in Solano County, postmile 2.2	38.0944	122.2394	MAC Tech
4-35	Statewide Highway Runoff Characterization	680S - Solano County	Site 4-35 is located on Interstate 680 in Solano County, postmile 11.7	38.2065	122.1382	MAC Tech
4-36	Park & Ride Runoff Characterization	Willow Avenue East Park and Ride	Site 4-36 is located on Willow Avenue adjacent to Interstate 80, within Contra Costa County	38.0225	122.2617	MAC Tech
4-37	Maintenance Yard Runoff Characterization	Walnut Creek East Maintenance Station	Site 4-37 is located between West Main Street and Interstate 680, Walnut Creek, and is referred to as the Walnut Creek East Maintenance Station	37.9197	122.0632	MAC Tech
4-38	Statewide Highway Runoff Characterization	680N - Contra Costa County	Site 4-38 is located between Interstate 680 and Goodyear Road on the I-680 North Ramp, Contra Costa County, postmile 3.0	37.782	121.9773	MAC Tech
4-39	Statewide Highway Runoff Characterization	580W - Alameda County	Site 4-39 is located between First Avenue and Interstate 580 West, on I-580 Westbound, Alameda County	37.7031	121.756	MAC Tech
5-03	Statewide Highway Runoff Characterization	25S - San Benito Co. - Dist. 5	Rolling grassy hills	36.7819	121.3131	Geomatrix
5-04	Statewide Highway Runoff Characterization	46E - San Luis Obispo Co. - Dist. 5	Rolling grassy hills	35.64443	120.67497	Geomatrix
5-05	Statewide Highway Runoff Characterization	227N - San Luis Obispo Co. - Dist. 5	Rolling grassy hills	35.2235	120.62468	Geomatrix
5-06	Statewide Highway Runoff Characterization	1S - Santa Cruz Co. - Dist. 5	Rolling grassy hills with oaks and eucalyptus	36.9352	121.8244	Geomatrix
5-07	Rest Area Runoff Characterization	101N - Camp Roberts Rest Area - Dist. 5	Rolling grassy hills	35.83197	120.7583	Geomatrix
6-05	Statewide Highway Runoff Characterization	198E - Kings Co. - Dist.6	Flat agricultural land	36.2722	119.83052	Geomatrix
6-06	Statewide Highway Runoff Characterization	99S - Tulare Co. - Tulare - Dist. 6	Flat agricultural land	36.50352	119.54368	Geomatrix
6-07	Rest Area Runoff Characterization	99S - Philip S. Raine Rest Area - Dist. 6	Flat agricultural land	36.052	119.3127	Geomatrix

## 2002-2003 Monitoring Sites

Monitoring Site ID	Study Name	Site Name	Site Description	Latitude	Longitude	Data Provider
6-205	Statewide Highway Runoff Characterization	180E - Fresno Co. - Dist. 6	Freeway catchment / fill slope	36.75111	119.7925	Geomatrix
6-209	Statewide Highway Runoff Characterization	41N - Fresno Co. - Dist. 6	Freeway catchment / fill slope	36.77611	119.79	Geomatrix
7-186	Park & Ride Runoff Characterization	Carson Park and Ride	Site 7-186 is located off Interstate 110 and Carson Street, Los Angeles County, postmile 7.02	33.8323	118.2879	MAC Tech
7-187	Park & Ride Runoff Characterization	Pathfinder Road Park and Ride	Site 7-187 is located off Route 57 and Pathfinder Road, Los Angeles County, postmile 3.7	33.9863	117.8425	MAC Tech
7-201	Additional Highway Runoff Characterization, First Flush Characterization Study	UCLA-1	Urban Highway Runoff	34.16	118.48	UCLA
7-202	Additional Highway Runoff Characterization, First Flush Characterization Study	UCLA-2	Urban Highway Runoff	34.1	118.48	UCLA
7-203	Additional Highway Runoff Characterization, First Flush Characterization Study	UCLA-3	Urban Highway Runoff	34.05	118.44	UCLA
7-233	Litter Characterization Study	I-405 and Leadwell	Site located at the Leadwell St. cul-de-sac below Route 405 near Sherman Way undercrossing in Van Nuys.	34.21111	118.47389	CDM
7-238	Litter Characterization Study	I-10 at Halm	Site located in the City of Los Angeles on the eastbound side of I-10 at Halm Avenue, east of Robertson Blvd and west of La Cienega Ave.	34.03422	118.38442	CDM
7-239	Litter Characterization Study	SR-91 at Ardmore	Site located in the City of Bellflower on the westbound side of SR-91 at Beach Street, east of Ardmore Avenue	34.87667	118.12861	CDM
8-07	Statewide Highway Runoff Characterization	10E - Riverside Co. - Dist. 8	Desert mountain by a canyon	33.9633	117.0279	Geomatrix
8-08	Statewide Highway Runoff Characterization	10W - Riverside Co. - Dist. 8	Rural with rolling hills	33.96377	117.0283	Geomatrix
8-09	Park & Ride Runoff Characterization	15W - Baseline Park and Ride - Dist. 8	Rural area near foothills	34.12107	117.51558	Geomatrix

## 2002-2003 Monitoring Sites

Monitoring Site ID	Study Name	Site Name	Site Description	Latitude	Longitude	Data Provider
8-10	Statewide Highway Runoff Characterization	91E - Riverside County	Site 8-10 is located on Eastbound Route 91, adjacent to Sherman Road, Riverside County	33.882	117.5883	MAC Tech
8-201	Additional Highway Runoff Characterization, Roadside Vegetative Treatment Site Study	Moreno Valley 1	SR-60-EB at Frederick St.	33.94149	117.27362	URS
8-202	Roadside Vegetative Treatment Site Study	Moreno Valley 2	V-ditch 2.6 m from edge of pavement	33.94152	117.27395	URS
8-203	Roadside Vegetative Treatment Site Study	Moreno Valley 3	V-ditch 4.9 m from edge of pavement	33.94133	117.27296	URS
8-204	Roadside Vegetative Treatment Site Study	Moreno Valley 4	V-ditch 8m from edge of pavement	33.94124	117.27262	URS
8-205	Roadside Vegetative Treatment Site Study	Moreno Valley 5	V-ditch 9.9 m from edge of pavement	33.9414	117.27364	URS
9-01	Statewide Highway Runoff Characterization	395 - Inyo Co. - Dist. 9	Dry, high plain	37.46472	118.58613	Geomatrix
10-02	Statewide Highway Runoff Characterization	120E - Tuolumne Co.- Dist. 10	Rolling Hills before foothills	37.8774	120.4455	Geomatrix
10-03	Statewide Highway Runoff Characterization	5N - San Joaquin Co. - Dist. 10	Flat industrial area	37.79553	121.30027	Geomatrix
10-04	Statewide Highway Runoff Characterization	132E - Mariposa Co. - Dist. 10	Rolling Hills before foothills	37.7123	120.3167	Geomatrix
10-05	Park & Ride Runoff Characterization	99S - Hammer Ln. Park & Ride - Dist. 10	Flat business/retail area	38.01998	121.25882	Geomatrix
11-100	Statewide Highway Runoff Characterization	805N - San Diego County	Site 11-100 is located off Interstate 805 northbound shoulder, San Diego County, postmile 14.9	32.7318	117.1105	MAC Tech
11-101	Statewide Highway Runoff Characterization	8W - San Diego County	Site 11-101 is located off the westbound shoulder of Interstate 8, adjacent to the National Guard Armory, San Diego County, postmile 14.6	32.8	116.9763	MAC Tech
11-103	Free-Flowing Highway Runoff Characterization	5N - San Onofre	Site 11-103 is located off interstate 5 near the San Clemente Immigration Checkpoint, San Diego County, postmile 66.6	33.3582	117.5331	MAC Tech

## 2002-2003 Monitoring Sites

Monitoring Site ID	Study Name	Site Name	Site Description	Latitude	Longitude	Data Provider
11-203	CVIF Runoff Characterization	San Onofre	Site 11-203 is located within the San Onofre Commercial Vehicle Inspection Facility on northbound Interstate 5	33.066	117.0691	MAC Tech
11-204	Additional Highway Runoff Characterization, Roadside Vegetative Treatment Site Study	Camp Pendleton 1	I-5-NB south of the Basilone exit	33.37979	117.56791	URS
11-205	Roadside Vegetative Treatment Site Study	Camp Pendleton 2	V-ditch 1.3 m from edge of pavement	33.37993	117.5682	URS
11-206	Roadside Vegetative Treatment Site Study	Camp Pendleton 3	V-ditch 5.3 m from edge of pavement	33.38015	117.56869	URS
11-207	Roadside Vegetative Treatment Site Study	Camp Pendleton 4	V-ditch 9.9 m from edge of pavement	33.38019	117.56867	URS
11-208	Congested Highway Runoff Characterization	15S - Via Rancho Parkway	Site 11-208 is located on Interstate 15, approximately 0.3 miles south of the Via Rancho Parkway exit.	33.066	117.0691	MAC Tech
11-209	Congested Highway Runoff Characterization	5N - Lomas Sante Fe	Site 11-209 is located south of the Lomas Sante Fe off-ramp	32.9909	117.2556	MAC Tech
11-97	Free-Flowing Highway Runoff Characterization	15S - Miramar	Site 11-97 is located off the shoulder of Interstate 15 between Miramar Way and Miramar Road, San Diego County, postmile 13.75	32.8867	117.1127	MAC Tech
11-98	Statewide Highway Runoff Characterization	805S - San Diego County	Site 11-98 is located off the shoulder of Interstate 805 near Miramar Way, San Diego County	32.8843	117.2027	MAC Tech
12-10	Maintenance Yard Runoff Characterization	Sand Canyon Toll Road Maintenance Station	Site 12-10 is located at 6685 Marine Way, Irvine, Orange County	33.6789	117.7536	MAC Tech
12-11	Park & Ride Runoff Characterization	Junipero Serra Park and Ride	Site 12-11 is located off Interstate 5 and Junipero Serra Road, Orange County, postmile 10.9	33.5207	117.6648	MAC Tech
12-210	Additional Highway Runoff Characterization, Compost Media Filter	73N506R - Orange Co - Dist. 12	NB 73 Hwy before Greenfield Exit; a low density residential site within the foothills	33.5585	117.6829	Geomatrix
12-211	Compost Media Filter	73N506R - Orange Co - Dist. 12	NB 73 Hwy before Greenfield Exit; a low density residential site within the foothills	33.5585	117.6829	Geomatrix

## 2002-2003 Monitoring Sites

Monitoring Site ID	Study Name	Site Name	Site Description	Latitude	Longitude	Data Provider
12-212	Compost Media Filter	73N506R - Orange Co - Dist. 12	NB 73 Hwy before Greenfield Exit; a low density residential site within the foothills	33.5585	117.6829	Geomatrix
12-214	Additional Highway Runoff Characterization, Compost Media Filter	73N604R - Orange Co. - Dist. 12	West of La Paz Avenue Onramp to NB 73 Hwy; a low-density residential site within the foothills	33.57354	117.7065	Geomatrix
12-215	Additional Highway Runoff Characterization, Compost Media Filter	73N604R - Orange Co. - Dist. 12	West of La Paz Avenue Onramp to NB 73 Hwy; a low-density residential site within the foothills	33.57354	117.7065	Geomatrix
12-216	Additional Highway Runoff Characterization, Compost Media Filter	73N604R - Orange Co. - Dist. 12	West of La Paz Avenue Onramp to NB 73 Hwy; a low-density residential site within the foothills	33.57354	117.7065	Geomatrix
12-217	Compost Media Filter	73N604R - Orange Co. - Dist. 12	West of La Paz Avenue Onramp to NB 73 Hwy; a low-density residential site within the foothills	33.57354	117.7065	Geomatrix
12-218	Compost Media Filter	73N604R - Orange Co. - Dist. 12	West of La Paz Avenue Onramp to NB 73 Hwy; a low-density residential site within the foothills	33.57354	117.7065	Geomatrix
12-219	Compost Media Filter	73N604R - Orange Co. - Dist. 12	West of La Paz Avenue Onramp to NB 73 Hwy; a low-density residential site within the foothills	33.57354	117.7065	Geomatrix
12-220	Additional Highway Runoff Characterization, Compost Media Filter	73S785L - Orange Co. - Dist. 12	West of Laguna Canyon Road Offramp from SB 73 Hwy; a low-density residential site within the foothills	33.58345	117.7281	Geomatrix
12-221	Additional Highway Runoff Characterization, Compost Media Filter	73S785L - Orange Co. - Dist. 12	West of Laguna Canyon Road Offramp from SB 73 Hwy; a low-density residential site within the foothills	33.58345	117.7281	Geomatrix
12-222	Compost Media Filter	73S785L - Orange Co. - Dist. 12	West of Laguna Canyon Road Offramp from SB 73 Hwy; a low-density residential site within the foothills	33.58345	117.7281	Geomatrix
12-223	Compost Media Filter	73S785L - Orange Co. - Dist. 12	West of Laguna Canyon Road Offramp from SB 73 Hwy; a low-density residential site within the foothills	33.58345	117.7281	Geomatrix
12-225	Additional Highway Runoff Characterization, Roadside Vegetative Treatment Site Study	Yorba Linda 1	SR-91-EB between Weir Canyon and SR241 exits	33.87035	117.73541	URS

### 2002-2003 Monitoring Sites

Monitoring Site ID	Study Name	Site Name	Site Description	Latitude	Longitude	Data Provider
12-226	Roadside Vegetative Treatment Site Study	Yorba Linda 2	V-ditch 2.3/1.4 m from edge of pavement	33.87042	117.73592	URS
12-227	Roadside Vegetative Treatment Site Study	Yorba Linda 3	V-ditch 5.4/4.4 m from edge of pavement	33.87047	117.73634	URS
12-228	Roadside Vegetative Treatment Site Study	Yorba Linda 4	V-ditch 7.6 m from edge of pavement	33.87048	117.73674	URS
12-229	Roadside Vegetative Treatment Site Study	Yorba Linda 5	V-ditch 13m from edge of pavement	33.87014	117.73499	URS
12-230	Additional Highway Runoff Characterization, Roadside Vegetative Treatment Site Study	Sand Canyon 1	I-405-NB at the Sand Canyon exit	33.65698	117.77606	URS
12-231	Roadside Vegetative Treatment Site Study	Sand Canyon 2	V-ditch 3.3 m from edge of pavement	33.65713	117.77626	URS
12-232	Roadside Vegetative Treatment Site Study	Sand Canyon 3	V-ditch 6m from edge of pavement	33.65728	117.77646	URS
12-233	Roadside Vegetative Treatment Site Study	Sand Canyon 4	V-ditch 13m from edge of pavement	33.65694	117.77577	URS
12-260	Litter Characterization Study	SR-73 - Site 1085L	Site located adjacent to the southbound SR-73 off ramp to Bonita Canyon Drive	33.63194	117.84306	CDM
